

**METHOD AND SYSTEM FOR IMPLEMENTING DATABASE CONNECTION
MAPPING FOR REPORTING SYSTEMS**

Abstract

5 A method and system for implementing database connection mapping for mapping a user
who may be associated with a group of users to an appropriate database via a database
connection wherein the database connection comprises information for locating and logging into
the appropriate database. A centralized server may control the access to databases, thereby
ensuring efficient use of database resources. A user may log into a server and then be mapped to
10 an appropriate database via a database name and login, provided by a database connection.
Database connection mapping may provide the ability to map multiple users to the same database
login as well as the ability to map different users to different database logins.
